

# **Caged Ball LM Guide**

Ball Cage Effect Global Standard Size

### **Ball Cage Effect**

The early forms of ball bearings were full-ball types without ball cages. Friction between balls caused loud noise, made high-speed rotation impossible and shortened the service life. Twenty years later, a Caged Ball design was developed for ball bearings. The new design enabled high-speed rotation at a low noise level, and extended the service life despite the reduced number of balls used. It marked a major development in the history of ball bearings.

Similarly, the quality of needle bearings was significantly improved by the caged needle structure.

With cage-less, full-ball types of ball bearings, balls make metallic contact with one another and produce loud noise. In addition, they rotate in opposite directions, causing the sliding contact between two adjacent balls to occur at a speed twice the ball-spinning rate. It results in severe wear and shortens the service life.

In addition, without a cage, balls make point contact to increase bearing stress, thus facilitating breakage of the oil film. In contrast, each caged ball contacts the cage over a wide area. Therefore, the oil film does not break, the noise level is low and balls can rotate at a high speed, resulting in a long service life.

- **Superbly High Speed**
- Low Noise, Acceptable Running Sound
- **Smooth Motion**

#### Conventional structure

- Adjacent balls contact each other at a point. As a result, contact stress is high and the oil film breaks due to friction.
- The service life becomes shorter.

### Caged Ball structure

- ●The service life is prolonged due to the elimination of wear caused by friction between balls.
- The absence of friction between balls results in reduced heat
- generation during high-speed rotation.

  The absence of friction between balls eliminates collision noise of
- The even spacing of the balls enables them to move smoothly
- Retention of lubricant in the ball cage ensures a long service life.

### Caged Ball LM Guide

Rotary ball bearing

With the Caged Ball LM Guide, the use of a ball cage allows lines of evenly spaced balls to circulate, thus eliminating friction between the balls.

In addition, grease held in a space between the ball circulation path and the ball cage (grease pocket) is applied on the contact surface between each ball and the ball cage as the ball rotates, forming an oil film on the ball surface. This minimizes the risk of oil-film

Conventional structure

Caged Ball structure

# Global Standard Type Caged Ball LM Guide

Balls roll in four rows of raceways precision-ground on an LM rail and an LM block, and ball cages and endplates incorporated in the LM block allow the balls to circulate.

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse-radial and lateral directions), enabling the LM Guide to be used in all orientations. In addition, the LM block can receive a well-balanced preload, increasing the rigidity in the four directions while maintaining a constant, low friction coefficient. With the low sectional height and the high rigidity design of the LM block, SHS achieves highly accurate and stable linear motion.

### 4-way equal load

Each row of balls is placed at a contact angle of 45° so that the rated loads applied to the LM block are uniform in the four directions (radial, reverse-radial and lateral directions), enabling the LM Guide to be used in all orientations and in extensive applications.

### Self-adjustment capability

The self-adjustment capability through Face-to-Face configuration of THK's unique circular-arc grooves (DF set) enables a mounting error to be absorbed even under a preload, thus achieving highly accurate, smooth linear motion.

### Global standard size

SHS is designed to have dimensions almost the same as that of model HSR, which THK as a pioneer of the linear motion system has developed and is practically a global standard model.

### Low center of gravity, high rigidity

As a result of downsizing the LM rail section, the center of gravity is lowered and the rigidity is increased.

# **SHS Outline**

**Model SHS - Product Overview** 

Model SHS has the same dimensions as model HSR, which is the de facto global standard full-ball LM guide, and can be mounted in any orientation since it is 4-way equal load type.

Major applications Machining center / NC lathe / drilling machine / electric discharge machine / conveyance system.

### **Model SHS-C**

The flange of the LM block has tapped holes. It can be mounted from the top or the bottom. It can be used in places where the table cannot have through holes for mounting bolts.

### Model SHS-LC The LM block has the same sectional shape as model SHS-C, but has a

The LM block has the same sectional shape as model SHS-C, but has a longer overall LM block length (L) and a greater rated load capacity.

| SHS          | 15LC  | ●SHS         | 35LC  |

SHS 45LCSHS 55LCSHS 65LC

### **Model SHS-V**

The LM block has a smaller width (W) and is equipped with tapped holes. It is suitable for places where space for the table width is limited.

- **OSHS 15V** OSHS 35V **OSHS 20V** OSHS 45V
- OSHS 55V **OSHS 25V SHS 30V** OSHS 65V

### **Model SHS-LV**

The LM block has the same sectional shape as model SHS-V, but has a longer overall LM block length (L) and a greater rated load capacity.

- ●SHS 15LV **OSHS 35LV**
- SHS 20LV **OSHS 45LV**
- ●SHS 25LV **OSHS 55LV**
- ●SHS 65LV SHS 30LV

### **Model SHS-R**

The LM block has a smaller width (W) and the mounting holes are tapped. It succeeds the height dimension of full-ball type LM Guide HSR-R.

- **OSHS 15R**
- **OSHS 35R**
- **SHS 25R**
- **OSHS 45R**
- OSHS 30R
- OSHS 55R

### **Model SHS-LR**

The LM block has the same sectional shape as model SHS-R, but has a longer overall LM block length (L) and a greater rated load capacity.

- ●SHS 25LR ●SHS 45LR
- **OSHS 35LR**
- ●SHS 30LR ●SHS 55LR

### \*1: Dimensional table for model SHS

Model SHS-C / SHS-LC → pages 11-12

Model SHS-V / SHS-LV → pages 13-14

Model SHS-R / SHS-LR → pages 15-16

### **Rated Loads in All Directions**

Model SHS is capable of receiving loads in all four directions: radial, reverse-radial and lateral directions.

The basic load ratings are uniform in the four directions (radial, reverse-radial and lateral directions), and their actual values are provided in the dimensional table\*1 for SHS.

### **Equivalent Load**

When the LM block of model SHS receives loads in all directions simultaneously, the equivalent load is obtained from the equation below.

$$P_E = P_R (P_L) + P_T$$

#### where

 $P_E$ : Equivalent load (N)  $P_R$ : Radial load (N)
-Radial direction  $P_L$ : Reverse-radial load (N)
-Reverse-radial direction  $P_T$ : Lateral load (N)

·Lateral direction

The service life of an LM Guide is subject to variations even under the same operational conditions. Therefore, it is necessary to use the nominal life defined below as a reference value for obtaining the service life of the LM Guide.

### Nominal life

The nominal life means the total travel distance that 90% of a group of units of the same LM Guide model can achieve without flaking (scale-like exfoliation on the metal surface) after individually running under the same conditions.

### Service life time

Once the nominal life (L) has been obtained, the service life time can be obtained using the equation on the right if the stroke length and the number of reciprocations are constant.

### $L = \left(\frac{f_{\text{H}} \cdot f_{\text{T}} \cdot f_{\text{c}}}{f_{\text{W}}} \cdot \frac{C}{P_{\text{c}}}\right)^{3} \times 50$

: Nominal life (km

C : Basic dynamic load rating\*1 (N)

Pc : Calculated load (N)

f<sub>H</sub> : Hardness factor (see Fig. 1)

f<sub>⊤</sub> : Temperature factor

 $f_{\text{c}}$  : Contact factor (see Table 1)

fw : Load factor (see Table 2)

$$L_h = \frac{L \times 10^6}{2 \times \ell_s \times n_1 \times 60}$$

 $L_h$ : Service life time (h)  $\ell$  s: Stroke length (mm)

n<sub>1</sub>: No. of reciprocations per min (min<sup>-1</sup>)

### ■f<sub>H</sub>: Hardness factor

To ensure the achievement of the optimum load capacity of the LM Guide, the raceway hardness must be between 58 and 64 HRC.

At hardness below this range, the basic dynamic and static load ratings decrease. Therefore, the rating values must be multiplied by the respective hardness factors (fin).

Since the LM Guide has sufficient hardness, the fn value for the LM Guide is normally 1.0 unless otherwise specified.

#### Ifc : Contact factor

When multiple LM blocks are used in close contact with each other, it is difficult to achieve uniform load distribution due to moment loads and mounting-surface accuracy. When using multiple blocks in close contact with each other, multiply the basic load rating (C or C<sub>0</sub>) by the corresponding contact factor indicated in Table 1.

Note: When uneven load distribution is expected in a large machine, consider using a contact factor from Table 1.

### Table 1 Contact Factor (fc)

| Number of blocks used in close contact | Contact factor fc |
|--|-------------------|
| 2                                      | 0.81              |
| 3                                      | 0.72              |
| 4                                      | 0.66              |
| 5                                      | 0.61              |
| 6 or more                              | 0.6               |
| Normal use                             | 1                 |

#### If : Temperature factor

Since the service temperature of Caged Ball LM Guides is normally 80°C or below, the  $f_{\rm T}$  value is 1.0.

#### fw: Load factor

In general, reciprocating machines tend to produce vibrations or impact during operation. It is especially difficult to accurately determine all vibrations generated during high-speed operation and impacts produced each time the machine starts and stops. Therefore, where the effects of speed and vibration are estimated to be significant, divide the basic dynamic load rating (C) by a load factor selected from Table 2, which contains empirically obtained data.

#### Table 2 Load Factor (fw)

| Vibration/impact | Speed (V)   | fw         |
|------------------|---|------------|
| Faint            | Very slow<br>V≦0.25m/s                                    | 1 to 1.2   |
| Weak             | Slow<br>0.25 <v≦1m s<="" td=""><td>1.2 to 1.5</td></v≦1m> | 1.2 to 1.5 |
| Medium           | Medium<br>1 <v≦2m s<="" td=""><td>1.5 to 2</td></v≦2m>    | 1.5 to 2   |
| Strong           | Fast<br>V>2m/s  | 2 to 3.5   |

### \*1: Basic dynamic load rating (C)

It refers to a load with a constant magnitude and direction under which the nominal life (L) of a group of identical LM Guide units independently operating is

#### \*1: Preload

Preload is an internal load applied to the rolling elements (balls) of an LM block in advance in order to increase its rigidity.

The clearance of all model SHS units is adjusted to the designated value before being shipped. Therefore, it is unnecessary to adjust the preload.

### **Radial Clearance Standard**

Since the radial clearance of an LM Guide greatly affects the running accuracy, load carrying capacity and rigidity of the LM Guide, it is important to select an appropriate clearance according to the application.

In general, selecting a negative clearance (i.e., a preload\*1 is applied) while taking into account possible vibrations and impact generated from reciprocating motion favorably affects the service life and the accuracy.

Unit:  $\mu$ m

| Indication symbol | Normal    | Light preload | Medium preload |
|-------------------|-----------|---------------|----------------|
| Model No.         | No symbol | C1            | C0             |

| 55                | –15 to 0  | −28 to −16    | –38 to –28     |
| 65                | -18 to 0  | −34 to −22    | -45 to -34     |

### Model SHS - Product Overview

### **Accuracy Standard**

The accuracy of model SHS is specified in terms of running parallelism (1), dimensional tolerance for height and width, and height and width difference between a pair (12.13) when two or more LM blocks are used on one rail or when two or more rails are mounted on the same plane.

The accuracy of model SHS is categorized into Normal grade (no symbol), High-accuracy grade (H), Precision grade (P), Super precision grade (SP) and Ultra precision grade (UP), as indicated in the table below.

Unit: mm

|           | Accuracy standard                                  | Nomal grade                 | High-accuracy grade | Precision grade  | Super precision grade | Unit: mm  Ultra precision grade |  |  |  |  |
|-----------|--|-----------------------------|---------------------|------------------|-----------------------|---------------------------------|--|--|--|--|

#### \*1: Running parallelism

It refers to the parallelism error between the LM block and the LM rail datum plane when the LM block travels the whole length of the LM rail with the LM rail secured on the reference datum plane using bolts.

#### \*2: Difference in height M

It indicates the difference between the minimum and maximum values of height (M) of each of the LM blocks used on the same plane in combination.

#### \*3: Difference in width W2

It indicates the difference between the minimum and maximum values of the width (W<sub>2</sub>) between each of the LM blocks, mounted on one LM rail in combination, and the LM rail.

### **Shoulder Height of the Mounting Base and the Corner Radius**

Normally, the mounting base for the LM rail and the LM block has a datum plane on the side face of the shoulder of the base in order to allow easy installation and highly accurate positioning.

The corner of the mounting shoulder must be machined to have a recess, or machined to be smaller than the corner radius "r," to prevent interference with the chamfer of the LM rail or the LM block.

Shoulder for the LM block

Unit: mm

| Model No. | Corner radius<br>r (max) | Shoulder height<br>for the LM rail<br>H1 | Shoulder height for the LM block H <sub>2</sub> | E    |  |  |

### **Error Allowance in the Parallelism Between Two Rails**

The following table shows error allowances in parallelism (P) between two rails that will not affect the service life in normal operation.

Unit:  $\mu$ m

| Model No. | Clearance C0 | Clearance C1 | Normal clearance |  |  |
|-----------|--------------|--------------|------------------|--|--|
| 15        | _            | 18           | 25               |  |  |
| 20        | 18           | 20           | 25               |  |  |
| 25        | 20           | 22           | 30               |  |  |
| 30        | 27           | 30           | 40               |  |  |
| 35        | 30           | 35           | 50               |  |  |
| 45        | 35           | 40           | 60               |  |  |
| 55        | 45           | 50           | 70               |  |  |
| 65        | 55           | 60           | 80               |  |  |

### **Error Allowance in Vertical Level Between Two Rails**

The values in the table indicate the error allowance in vertical level (S) between two rails per 500 mm of the axis-to-axis distance, and are proportional to the axis-to-axis distance.

Unit:  $\mu$ m

| Model No. | Clearance C0 | Clearance C1 | Normal clearance |
|-----------|--------------|--------------|------------------|
| 15        | _            | 85           | 130              |
| 20        | 50           | 85           | 130              |
| 25        | 70           | 85           | 130              |
| 30        | 90           | 110          | 170              |
| 35        | 120          | 150          | 210              |
| 45        | 140          | 170          | 250              |
| 55        | 170          | 210          | 300              |
| 65        | 200          | 250          | 350              |

# Example of model number coding

Model number 2 Type of LM block 3 No. of LM blocks used on the same rail 4 With QZ Lubricator

Contamination protection accessory symbol (see page 19) 6 Radial clearance symbol (see page 7)

ILM rail length (in mm) ■Accuracy symbol (see page 8) With steel tape INo. of rails used on the same plane

Note This model number indicates that an LM block and an LM rail constitute one set (i.e., the required number of sets when 2 rails are used in parallel is 2).

Those models equipped with QZ Lubricator cannot have a grease nipple.

Unit: mm

# Example of model number coding

Model number 2Type of LM block 3No. of LM blocks used on the same rail 4With QZ Lubricator

Contamination protection accessory symbol (see page 19) 6 Radial clearance symbol (see page 7)

ILM rail length (in mm) ■Accuracy symbol (see page 8) With steel tape INo. of rails used on the same plane

Note This model number indicates that an LM block and an LM rail constitute one set (i.e., the required number of sets when 2 rails are used in parallel is 2).

Those models equipped with QZ Lubricator cannot have a grease nipple.

Unit: mm

### Example of model number coding

- Model number 2 Type of LM block 3 No. of LM blocks used on the same rail 4 With QZ Lubricator
- 5 Contamination protection accessory symbol (see page 19) 6 Radial clearance symbol (see page 7)
- ZLM rail length (in mm) 3 Accuracy symbol (see page 8) 9 With steel tape 10 No. of rails used on the same plane

Note This model number indicates that an LM block and an LM rail constitute one set (i.e., the required number of sets when 2 rails are used in parallel is 2).

Those models equipped with QZ Lubricator cannot have a grease nipple.

Unit: mm

\*2 The maximum length under "Length" indicates the standard maximum length of an LM rail.

\*3 Static permissible moment:

1 block: permissible static moment value with 1 LM block

Double blocks: permissible static moment value with 2 blocks closely contacting with each

<sup>\*1</sup> Pilot holes for side nipples are not drilled through in order to prevent foreign material from entering the product. THK will mount grease nipples per your request. Therefore, do not use the side nipple pilot holes for purposes other than mounting a grease nipple.

# SHS

### Standard Length and Maximum Length of the LM Rail

The table below shows the standard LM rail lengths and the maximum lengths of model SHS variations. If the maximum length of the desired LM rail exceeds them, connected rails will be used. Contact THK for details.

For the G dimension when a special length is required, we recommend selecting the corresponding G value from the table. The longer the G dimension is, the less stable the G area may become after installation, thus adversely affecting accuracy.

Standard Length and Maximum Length of the LM Rail for Model SHS

Unit: mm

Note 1: The maximum length varies with accuracy grades. Contact THK for details.

Note 2: If connected rails are not allowed and a greater length than the maximum values above is required, contact THK  $\ .$ 

# **SHS OPTIONS**

### **Options**

For model SHS, contamination protection and lubrication accessories are available. Make a selection according to the application and the installation site.

### **Contamination Protection Accessories**

When foreign matter enters an LM system, it will cause abnormal wear or shorten the service life. It is necessary to prevent foreign matter from entering the system. Therefore, when possible entrance of foreign matter is predicted, it is important to select an effective sealing device or contamination protection device that meets the working conditions.

### 2 Side seal

Used in locations where dust may enter the LM block from the side or bottom surface, such as vertical, horizontal and inverted mounts.

### 3 Inner seal

Used in locations severely exposed to dust or cutting chips.

### **Seals and Scrapers**

### 1 to 4 Seals

Highly wear-resistant end seals made of special resin rubber and side seals for increased contamination protection effect are available.

If desiring a contamination protection accessory, specify it with the corresponding symbol indicated in table 3.

For the supported model numbers for contamination protection accessories and the overall LM block length with a contamination protection accessory attached (dimension L), see table 4.

### Seal resistance value

For the maximum seal resistance value per LM block when a lubricant is applied on seal SHS ··· SS, refer to the corresponding value provided in table 1.

Table 1 Maximum Seal Resistance Value of Seal SHS ··· SS

Unit: N

|           | OTHE. 14              |
|-----------|-----------------------|
| Model No. | Seal resistance value |
| 15        | 4.5                   |
| 20        | 7.0                   |
| 25        | 10.5                  |
| 30        | 17.0                  |
| 35        | 20.5                  |
| 45        | 30.0                  |
| 55        | 31.5                  |
| 65        | 43.0                  |

### 5 6 Scrapers

Laminated Contact Scraper LaCS®

For locations with an even more adverse working conditions, the Laminated Contact Scraper LaCS is available.

LaCS removes minute foreign matter adhering to the LM rail in multiple stages and prevents it from entering the LM block with a laminated contact structure (3-layer scraper).

#### **Features**

- Since the 3 layers of scrapers fully contact the LM rail, LaCS is highly capable of removing minute foreign matter.
- Since it uses oil-impregnated, foam synthetic rubber with a self-lubricating function, low friction resistance is achieved.

### Basic Specifications of LaCS

- ① Service temperature range of LaCS: -20°C to +80°C
- ② Resistance of LaCS: indicated in table 2

\*Note that LaCS is not sold alone

Table 2 Resistance of LaCS

Unit: N

| Model No. | Resistance of LaCS |
|-----------|--------------------|
| 15        | 5.2                |
| 20        | 6.5                |
| 25        | 11.7               |
| 30        | 18.2               |
| 35        | 20.8               |
| 45        | 26.0               |
| 55        | 32.5               |
| 65        | 39.0               |

Note 1: Each resistance value in the table only consists of that of LaCS, and does not include sliding resistances of seals and other accessories.

Note 2: For the maximum service speed of LaCS, contact THK.

Table 3 Symbols of Contamination Protection Accessories for Model SHS

| Symbol | Contamination protection accessory                                |
|--------|---|
| UU     | With end seal   |
| SS     | With end seal + side seal + inner seal                            |
| DD     | With double seals + side seal + inner seal                        |
| ZZ     | With end seal + side seal + inner seal + metal scraper            |
| KK     | With double seals + side seal + inner seal + metal scraper        |
| SSHH   | With end seal + side seal + inner seal + LaCS                     |
| DDHH   | With double seals + side seal + inner seal + LaCS                 |
| ZZHH   | With end seal + side seal + inner seal + metal scraper + LaCS     |
| KKHH   | With double seals + side seal + inner seal + metal scraper + LaCS |

### For Models Attached with Contamination Protection Accessories SSHH, DDHH, ZZHH or KKHH

Models attached with dust prevention accessories SSHH, DDHH, ZZHH or KKHH have a grease nipple in the location indicated in the figure below. The table on the right shows incremental dimensions with the grease nipple.

Note: When desiring the mounting location for the grease nipple other than the one indicated in the figure above, contact THK.

|             | Incremental     |             |

### For Models Attached with Contamination Protection Accessories UU or SS

For the mounting location of the grease nipple (N) and its incremental dimension (E) when contamination protection accessories UU or SS are attached, see the corresponding dimensional table (see page 11 to 16).

### For Models Attached with Contamination Protection Accessories DD, ZZ or KK

For the mounting location of the grease nipple and its incremental dimension when contamination protection accessories DD, ZZ or KK are attached, contact THK.

### **Dedicated bellows JSH** for model SHS

Used in locations exposed to dust or cutting chips.

### Models SHS15 to 30

#### Models SHS35 to 65

Note 1: When desiring to use the dedicated bellows other than in horizontal mount (i.e., vertical, wall and inverted mount), or when desiring a heat-resistant type of bellows, contact THK.

Note 2: For lubrication when using the dedicated bellows, contact THK

Note 3: When using the dedicated bellows, the LM block and LM rail need to be machined so that the bellows can be mounted. Be sure to indicate that the dedicated bellows is required when ordering SHS.

Note: The length of the bellows is calculated as follows.

(A-1)

S: Stroke length (mm)

 $Lmax = Lmin \cdot A$ 

A: Extension rate

### **Dedicated C-cap**

It prevents cutting chips from entering the LM rail mounting holes.

### Steel tape SP

It prevents foreign matter, such as cutting chips, dust, or coolant from

### Dedicated Bellows JSH for Model SHS

For locations with an even more adverse working conditions, dedicated bellows are available. The dimensions of the dedicated bellows are provided below. When placing an order, specify the desired bellows type with the corresponding bellows model number indicated below.

Dimensional Table for JSH

|           |     | Main dimensions (mm) |      |    |      |        |                |        |                |            |    |                |           |  |  |

### 8 Dedicated C-cap for LM Rail Mounting Holes

If any of the LM rail mounting holes of an LM Guide is filled with cutting chips or foreign matter, they may enter the LM block structure. Entrance of such foreign matter can be prevented by covering each LM rail mounting hole with the dedicated cap so that the top of the mounting holes are on the same level as the LM rail top face.

The dedicated C-cap for LM rail mounting holes is highly durable since it uses a special synthetic resin with high oil resistance and high wear resistance. When placing an order, specify the desired cap type with the corresponding cap number indicated in the table on the right.

Major Dimensions of the Dedicated Cap

| Model No. | C-cap     | Bolt used | Main dimensions mm |     |  |
|-----------|-----------|-----------|--------------------|-----|--|
|           | model No. | Doit useu | D                  | Ι   |  |
| 15        | C 4       | M 4       | 7.8                | 1.0 |  |
| 20        | C 5       | M 5       | 9.8                | 2.4 |  |
| 25        | C 6       | M 6       | 11.4               | 2.7 |  |
| 30        | C 8       | M 8       | 14.4               | 3.7 |  |
| 35        | C 8       | M 8       | 14.4               | 3.7 |  |
| 45        | C12       | M12       | 20.5               | 4.7 |  |
| 55        | C14       | M14       | 23.5               | 5.7 |  |
| 65        | C16       | M16       | 26.5               | 5.7 |  |

### 9 Steel Tape SP

By covering the LM rail mounting holes with an ultra thin stainless steel (SUS304) plate, the steel tape SP further increases sealability of the end seal, thus preventing foreign matter and water from entering the top face of the LM rail.

Note 1: To mount the steel tape, the LM block needs to be removed from the LM rail. This requires an LM block removing/mounting jig. Contact THK for details.

Note 2: When mounting the steel tape, the LM rail needs to be machined. Indicate that the steel tape is required when ordering the LM Guide.

Note 3: The steel tape is available for models SHS15 to 65.

### **Lubrication Accessories**

### 10 QZ Lubricator™

The QZ Lubricator feeds the right amount of lubricant to the ball raceway on the LM rail. This allows an oil film to continuously be formed between the balls and the raceway, and drastically extends the lubrication and maintenance intervals.

When the QZ Lubricator is required, specify the desired type with the corresponding symbol indicated in table 1.

For supported LM Guide model numbers for the QZ Lubricator and overall LM block length with the QZ Lubricator attached (dimension L), see table 2.

**Significant Extension** 

Attaching the QZ Lubricator helps

extend the maintenance interval

throughout the whole load range

from the light-load area to the

of the Maintenance

Interval

heavy-load area.

### **Features**

- Supplements lost oil to drastically extend the lubrication/maintenance interval.
- Eco-friendly lubrication system that does not contaminate the surrounding area since it feeds the right amount of lubricant to the ball raceway.
- The user can select a type of lubricant that meets the intended use.

Note 1: The QZ Lubricator is not sold alone.

Note 2: Those models equipped with the QZ Lubricator cannot have a grease nipple.

Note 3: When desiring both the QZ Lubricator and a grease nipple to be attached, contact THK.

Table 1 Parts Symbols for Model SHS with the QZ Lubricator Attached

| Symbol | Contamination protection accessories for LM Guide with QZ Lubricator attached     |

The structure of the QZ Lubricator consists of three major components:

- ① a heavy oil-impregnated fiber net (functions to store lubricant).
- ② a high-density fiber net (functions to apply lubricant to the raceway).
- ③ an oil-control plate (functions to adjust oil flow). The lubricant contained in the QZ Lubricator is fed by the capillary phenomenon, which is used also in felt pens and many other products, as the fundamental principle.

### ┅晄 Caged Ball LM Guide Model SHS

### Precautions on use

#### Handling

- · Most models of this product are heavy articles (20 kg or heavier). When carrying the product, two or more people must hold it or conveyance equipment must be used. Failure to do so may cause personal injury or damage to the product.
- Disassembling components may cause dust to enter the system or degrade mounting accuracy of parts. Do not disassemble the
- Tilting an LM block or LM rail may cause them to fall by their own weight.
- Dropping or hitting the LM Guide may damage it. Giving an impact to the LM Guide could also cause damage to its function even if the guide looks intact.

#### Lubrication

- Thoroughly remove anti-corrosion oil and feed lubricant before using the product.
- · Do not mix lubricants of different physical properties.
- In locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, normal lubricants may not be used. Contact THK for details.
- · When planning to use a special lubricant, contact THK before using it.
- When adopting oil lubrication, the lubricant may not be distributed throughout the LM system depending on the mounting orientation of the system. Contact THK for details.
- · Lubrication interval varies according to the service conditions. Contact THK for details.

#### Precautions on Use

- · Entrance of foreign matter may cause damage to the ball circulating path or functional loss. Prevent foreign matter, such as dust or cutting chips, from entering the system.
- · When planning to use the LM system in an environment where coolant penetrates the LM block, it may cause trouble to product functions depending on the type of coolant. Contact THK for details.
- Do not use the LM system at temperature of 80°C or higher. When desiring to use the system at temperature of 80°C or higher. contact THK in advance.
- · If foreign matter adheres to the LM system, replenish the lubricant after cleaning the product. For available types of detergent, contact THK
- · When using the LM Guide with an inverted mount, breakage of the endplate due to an accident or the like may cause balls to fall out and the LM block to come off from the LM rail and fall. In these cases, take preventive measures such as adding a safety mechanism for preventing such falls.
- · When using the LM system in locations exposed to constant vibrations or in special environments such as clean rooms, vacuum and low/high temperature, contact THK in advance.
- · When removing the LM block from the LM rail and then replacing the block, an LM block mounting/removing jig that facilitates such installation is available. Contact THK for details.

· When storing the LM Guide, enclose it in a package designated by THK and store it in a horizontal orientation while avoiding high temperature, low temperature and high humidity.
